Format 1	opcode				dest d				source s				source t			
Format 2	opcode				dest d				addr							

OpCode	Operation	Fmt	Pseudocode
0	halt	1	<code>exit(0)</code>
1	add	1	<code>R[d] ← R[s] + R[t]</code>
2	subtract	1	<code>R[d] ← R[s] - R[t]</code>
3	and	1	<code>R[d] ← R[s] & R[t]</code>
4	xor	1	<code>R[d] ← R[s] ^ R[t]</code>
5	shift left	1	<code>R[d] ← R[s] << R[t]</code>
6	shift right	1	<code>R[d] ← R[s] >> R[t]</code>
7	load addr	2	<code>R[d] ← addr</code> (i.e. load 1-byte constant)
8	load	2	<code>R[d] ← mem[addr]</code>
9	store	2	<code>mem[addr] ← R[d]</code>
A	load indirect	1	<code>R[d] ← mem[R[t]]</code>
B	store indirect	1	<code>mem[R[t]] ← R[d]</code>
C	branch zero	2	<code>if (R[d] == 0) pc ← addr</code>
D	branch positive	2	<code>if (R[d] > 0) pc ← addr</code>
E	jump register	2	<code>pc ← R[d]</code>
F	jump and link	2	<code>R[d] ← pc; pc ← addr</code>

Register 0 is always 0.
 Loads from `[FF] ← stdin`.
 Stores to `[FF] → stdout`.
